- Video walkthrough (Google Drive, view access): [PLACEHOLDER — replace at the end]

WHAT I BUILT

A stdio **MCP server** that gives a Duvo agent a thin, audited StoreLink interface to run a Korral buyer's per-SKU replenishment decision — check on-hand vs the last 24h of sales and raise a replenishment order when the gap warrants — with per-store key authentication, rotation-safe retries, and separate FDE and buyer observability streams.

HOW TO RUN IT

See `DEPLOYMENT.md` in the repo. In short: `docker build` then `docker run --rm -i` — it's a stdio server (no port), launched as a subprocess of the agent. Details in the file.

NOTES

The final ~5 minutes of the video is a walkthrough of what I built, how, and why.
